

UNIVERSITY OF SARGODHA  
OFFICE OF THE REGISTRAR  
(ACAD BRANCH)

NOTIFICATION

The Academic Council in its 19<sup>th</sup> (4/2023) meeting held on 13.09.2023, has recommended the curricula of the following academic programs for implementation on provisional basis w.e.f Fall 2023 subject to approval by the Syndicate:-

1.	BS in Urdu	(Annex-'A')
2.	BS in Islamic Studies	(Annex-'B')
3.	BS in English (Linguistics)	(Annex-'C')
4.	BS in English (Language & Literature)	(Annex-'D')
5.	BS in Media and Communication Studies	(Annex-'E')
6.	BS in Physical Education	(Annex-'F')
7.	BS in Fine Arts	(Annex-'G')
8.	BS in Textile Design	(Annex-'H')
9.	BS in Graphic Design	(Annex-'I')
10.	BS in Chemistry	(Annex-'J')
11.	BS in Physics	(Annex-'K')
12.	BS in Statistics	(Annex-'L')
13.	BS in Botany	(Annex-'M')
✓ 14.	BS in Mathematics	(Annex-'N')
15.	BS in Geology	(Annex-'O')
16.	BS in Geography	(Annex-'P')
17.	BS in Zoology	(Annex-'Q')
18.	BS in History	(Annex-'R')
19.	BS in Pakistan Studies	(Annex-'S')
20.	BS in Education	(Annex-'T')
21.	BS in Sociology	(Annex-'U')
22.	BS in Social Work	(Annex-'V')
23.	BS in Economics	(Annex-'W')
24.	BS in Psychology	(Annex-'X')
25.	BS in International Relations	(Annex-'Y')
26.	BS in Political Science	(Annex-'Z')

  
(WAQAR AHMAD)  
Additional Registrar (General)

No. SU/Acad/23/1015

Dated: 01.11.2023

Distribution:

- Controller of Examinations (with the request to upload on University Website for affiliated Colleges)

C.C:

- Director Academics
- Director, QEC
- Additional Registrar (Affiliation & Registration)
- Secretary to the Vice-Chancellor
- PA to Registrar
- Notification File

# **SCHEME OF STUDIES**

## **BS in Mathematics**

(2023)

**DEPARTMENT OF MATHEMATICS**  
**UNIVERSITY OF SARGODHA**  
**SARGODHA**

1. Title of Degree Program: BS in Mathematics

2. Program Learning Objectives:

Graduates will be able to

- understand the mathematics theoretically and then visualized by computer programming.
- utilize the knowledge for professional skill development.
- demonstrate good communication skills in professional and academic presentations.
- upgrade knowledge and skills through professional experience and higher studies.

3. Program Structure:

Duration	Minimum 4-Years (8-Semesters)
Admission Requirements:	Eligibility: Intermediate/Part-I or equivalent with Mathematics (at least 45% marks in Intermediate & 50% marks in Mathematics).
Degree Completion Requirements:	Minimum 121 Credit Hours

4. General Education (Gen Ed) Requirements:(Mandatory/Core Courses):

(The minimum requirement for Gen Ed is 30 credits hours and will be offered in first four semesters Only)

Sr. No.	Semester	Course Code	Course Title	Credit Hours	Prerequisite
1.	2	URCG-5112	Fables, Wisdom and EPICS	2(2-0)	Nil
2.	4	URCG-5114	Basic Science	3(2-1)	Nil
3.	2	URCG-5116	Science of Society-I	2(2-0)	Nil
4.	1	URCG-5118	Functional English	3(3-0)	Nil
5.	3	URCG-5119	Expository Writing	3(3-0)	Nil
6.	2	URCG-5120	Exploring Quantitative Skills	3(3-0)	Nil
7.	3	URCG-5121	Tools for Quantitative Reasoning	3(3-0)	Nil
8.	1	URCG-5105 URCG-5126	Islamic Studies (OR) Religious Education/Ethics	2(2-0)	Nil
9.	3	URCG-5122	Ideology and Constitution of Pakistan	2(2-0)	Nil
10.	1	URCG-5123	Applications of Information and Communication Technologies (ICT)	3(2-1)	Nil
11.	4	URCG-5124	Entrepreneurship	2(2-0)	Nil
12.	4	URCG-5125	Civics and Community Engagement	2(2-0)	Nil
13.	1-8	URCG-5111	Translation of Holy Quran*	NC	Nil
14.	2	URCG-5127	Seerat of the Holy Prophet (SAW)*	1(1-0)	Nil
GE Courses Credit Hours Total				31	

\*These courses for Muslim students only.

**5. Single Major Courses:**

Sr. No.	Course Code	Course Title	Credit Hours	Prerequisite
1.	MATH-5101	Calculus-I	3(3-0)	Nil
2.	MATH-5102	Set Theory and Mathematical Logic	3(3-0)	Nil
3.	MATH-5103	Vector and Tensor Analysis	3(3-0)	Nil
4.	MATH-5104	Calculus-II	3(3-0)	MATH-5101
5.	MATH-5105	Linear Algebra	3(3-0)	Nil
6.	MATH-5106	Mechanics	3(3-0)	Nil
7.	MATH-5107	Calculus-III	3(3-0)	MATH-5104
8.	MATH-5108	Algebra-I	3(3-0)	Nil
9.	MATH-5109	Ordinary Differential Equations	3(3-0)	Nil
10.	MATH-5110	Algebra-II	3(3-0)	MATH-5108
11.	MATH-5111	Discrete Mathematics	3(3-0)	Nil
12.	MATH-5112	Number Theory	3(3-0)	Nil
13.	MATH-6101	Real Analysis-I	3(3-0)	Nil
14.	MATH-6102	Topology	3(3-0)	Nil
15.	MATH-6103	Differential Geometry	3(3-0)	Nil
16.	MATH-6104	Mathematical Methods	3(3-0)	Nil
17.	MATH-6105	Real Analysis-II	3(3-0)	MATH-6101
18.	MATH-6106	Classical Mechanics	3(3-0)	Nil
19.	MATH-6107	Complex Analysis	3(3-0)	Nil
20.	MATH-6108	Functional Analysis	3(3-0)	Nil
21.	MATH-6109	Numerical Analysis-I	3(3-0)	Nil
22.	MATH-6110	Partial Differential Equations	3(3-0)	Nil
23.	MATH-61xx	Elective-I**	3(3-0)	Nil
24.	MATH-61xx	Elective-II**	3(3-0)	Nil
25.	MATH-6112	Numerical Analysis-II	3(3-0)	MATH-6109
26.	MATH-6113	Integral Equations	3(3-0)	Nil
27.	MATH-61xx	Elective-III**	3(3-0)	Nil
28.	MATH-61xx	Elective-IV**	3(3-0)	Nil
<b>Major Courses Credit Hours Total</b>			<b>84</b>	

**6. Interdisciplinary/Allied courses: minimum 12 credit hours:**

*(Interdisciplinary/Allied courses will be offered after 4<sup>th</sup> semester)*

1.	STAT-5101	Introductory Statistics	3(3-0)	Nil
2.	STAT-5102	Introduction to Probability Distributions	3(3-0)	Nil
3.	CSEC-6101	Programming Languages for Mathematicians	3(3-0)	Nil
4.	CSEC-6102	Web System and Technology	3(3-0)	Nil
<b>Interdisciplinary Courses Credit Hours Total</b>			<b>12</b>	

**7. Field experience/internship: Minimum 03 credit hours:**

*(Lasting 6-8 weeks and ideally scheduled during summer breaks after 6<sup>th</sup> semester)*

1.	MATH-6111	Field experience/internship	3(3-0)	Nil
----	-----------	-----------------------------	--------	-----

**8. Capstone project: Minimum 03 credit hours:**

*(This project, after the sixth semester, requires faculty supervision and evaluation following department guidelines)*

1.	MATH-6114	Capstone project	3(3-0)	Nil
----	-----------	------------------	--------	-----

\*These courses for Muslim students only.

\*\* These four courses are optional & can be selected from the following list:

Note: These courses will be offered by the department from the list of concentration elective courses as per availability of the resources.

### List of Elective Courses

Course Code	Course Title	Credit Hours	Pre-Requisite
MATH-6115	Special Functions	3(3+0)	Nil
MATH-6116	Graph Theory	3(3+0)	Nil
MATH-6117	Advanced Group Theory-I	3(3+0)	Nil
MATH-6118	Advanced Group Theory-II	3(3+0)	MATH-6117
MATH-6119	Modern Algebra-I	3(3+0)	Nil
MATH-6120	Modern Algebra-II	3(3+0)	MATH-6119
MATH-6121	Algebraic Topology-I	3(3+0)	Nil
MATH-6122	Algebraic Topology-II	3(3+0)	MATH-6121
MATH-6123	Theory of Modules	3(3+0)	Nil
MATH-6124	Rings & Fields	3(3+0)	Nil
MATH-6125	Electromagnetism-I	3(3+0)	Nil
MATH-6126	Electromagnetism-II	3(3+0)	MATH-6125
MATH-6127	Fluid Mechanics-I	3(3+0)	Nil
MATH-6128	Fluid Mechanics-II	3(3+0)	MATH-6127
MATH-6129	Operations Research-I	3(3+0)	Nil
MATH-6130	Operations Research-II	3(3+0)	MATH-6129
MATH-6131	Analytical Dynamics	3(3+0)	Nil
MATH-6132	Special Relativity	3(3+0)	Nil
MATH-6133	Numerical Solution of Partial differential equations	3(3+0)	Nil
MATH-6134	Heat Transfer	3(3+0)	Nil
MATH-6135	Measure Theory	3(3+0)	Nil
MATH-6136	Theory of Splines-I	3(3+0)	Nil
MATH-6137	Theory of Splines-II	3(3+0)	MATH-6136
MATH-6138	Methods of Optimization-I	3(3+0)	Nil
MATH-6139	Methods of Optimization-II	3(3+0)	MATH-6138

Calculus is the mathematical study of continuous change. If quantities are continually changing, we need calculus to study what is going on. Calculus is concerned with comparing quantities which vary in a non-linear way. It is used extensively in science & engineering, since many of the things we are studying (like velocity, acceleration, current in a circuit) do not behave in a simple, linear fashion. Calculus has two major branches, differential calculus (Calculus-I) & integral calculus (Calculus-II); the former concerns instantaneous rates of change, & the slopes of curves, while integral calculus concerns accumulation of quantities, & areas under or between curves. This is the first course of the sequence, Calculus-I, II & III, serving as the foundation of advanced subjects in all areas of mathematics. The sequence, equally, emphasizes basic concepts & skills needed for mathematical manipulation. It focuses on the study of functions of a single variable. Calculus-I is an introduction to differential & integral calculus: the study of change.

### **Contents**

- 1 Functions & their graphs, Rates of change & tangents to curves
- 2 Limit of a function & limit laws, the precise definition of a limit
- 3 One-sided limits, continuity, Limits involving infinity; asymptotes of graphs
- 4 Differentiation: tangents & derivative at a point, the derivative as a function
- 5 Differentiation rules, the derivative as a rate of change
- 6 Derivatives of trigonometric functions, Chain rule, implicit differentiation
- 7 Related rates, linearization & differentials, higher derivatives
- 8 Applications of derivatives: extreme values of functions
- 9 Rolle's theorem, the mean value theorem, Monotonic functions & the first derivative test
- 10 Convexity, point of inflection & second derivative test, Concavity & curve sketching
- 11 Applied optimization, Antiderivatives, integration: area & estimating with finite sums
- 12 Sigma notation & limits of finite sums, definite integral, the fundamental theorem of calculus
- 13 Indefinite integrals & the substitution method, Substitution & area between curves
- 14 Applications of definite integrals: volumes using cross-sections
- 15 Volumes using cylindrical shells, arc length, Areas of surfaces of revolution
- 16 Transcendental functions: inverse functions & their derivatives
- 17 Natural logarithms, exponential functions, Indeterminate forms & L'Hôpital's rule
- 18 Inverse trigonometric functions, hyperbolic functions

2. Goldstein, L. J., Lay, D. C., Schneider, D. I., & Asmar, N. H. (2017). *Calculus & its applications* (14<sup>th</sup> ed.). London: Pearson.
3. Larson, R., & Edwards, B. H. (2013). *Calculus* (10<sup>th</sup> ed. /Latest). New York: Brooks Cole.

The main aim of this course is the study of set theory & the concept of mathematical logic. Everything mathematicians do can be reduced to statements about sets, equality & membership which are basics of set theory. This course introduces these basic concepts. The foundational role of set theory & its mathematical development has raised many philosophical questions that have been debated since its inception in the late nineteenth century. The course begins with propositional logic, including two-column proofs and truth table applications, followed by first-order logic, which provides the structure for writing mathematical proofs. Set theory is then introduced and serves as the basis for defining relations, functions, numbers, mathematical induction, ordinals, and cardinals. In particular, mathematicians have shown that virtually all mathematical concepts & results can be formalized within the theory of sets. The course aims at familiarizing the students with cardinals, ordinal numbers, relations, functions, Boolean algebra, fundamentals of propositional & predicate logics.

### Contents

- 1 Set theory: sets, subsets
- 2 Operations with sets: union, intersection, difference, symmetric difference
- 3 Cartesian product & disjoint union
- 4 Functions: graph of a function
- 5 Composition; injections, surjections, bijections, inverse function
- 6 Computing cardinals: Cardinality of Cartesian product, union
- 7 Cardinality of all functions from a set to another set
- 8 Cardinality of all injective, surjective & bijective functions from a set to another set
- 9 Infinite sets, finite sets, Countable sets, properties & examples
- 10 Operations with cardinal numbers. Cantor-Bernstein theorem
- 11 Relations: equivalence relations
- 12 Partitions, quotient set; examples
- 13 Parallelism, similarity of triangles
- 14 Order relations, min, max, inf, sup; linear order
- 15 Examples:  $\mathbb{N}$ ,  $\mathbb{Z}$ ,  $\mathbb{R}$ ,  $P(A)$ . Well ordered sets & induction
- 16 Inductively ordered sets & Zorn's lemma
- 17 Mathematical logic: propositional calculus. truth tables
- 18 Predicate calculus

This course is designed primarily for those students taking courses in mathematics. Vector and tensor algebra have in recent years become basic part of fundamental mathematical background required of those in engineering, sciences and allied disciplines. It is said that vector and tensor analysis is a natural aid in forming mental pictures of physical and geometrical ideas. A most rewarding language and mode of thought for the physical sciences. The focus, therefore, is to impart useful skills on the students in order to enhance their Mathematical ability in applying vector technique to solve problems in applied sciences and to equip them with necessary skill required to cope with higher levels courses in related subjects. Topics to be covered in this course include, basic vector algebra, coordinate bases, gradient, divergence, and curl, Green's, Gauss' and Stokes' theorems. The metric tensor, Christoffel symbols and Riemann curvature tensor. Applications will be drawn from differential geometry, continuum mechanics, electromagnetism, general relativity theory.

### *Contents*

- 1 Vector Analysis: Scalar triple product with applications
- 2 Vector triple product with applications
- 3 Gradient of a scalar function
- 4 Divergence of vector functions
- 5 Curl of vector functions
- 6 Application of the del operator
- 7 Curvilinear coordinates
- 8 Coordinates surfaces
- 9 Cartesian Tensors: Summation convention
- 10 Transformation equations
- 11 Orthogonally conditions
- 12 Kronecker delta & Levi-civita symbol
- 13 Tensors of different ranks
- 14 Symmetric & anti symmetric tensors
- 15 Related theorems
- 16 Application to Vector Analysis

2. Brand, L. (2006). *Vector analysis*, New York: Dover Publications.

This is the second course of the basic sequence Calculus serving as the foundation of advanced subjects in all areas of mathematics. The sequence, equally, emphasizes basic concepts & skills needed for mathematical manipulation. As continuation of Calculus-I, it focuses on the study of functions of a single variable. This Core Curriculum course is designed to meet the following four learning goals: Students will construct and evaluate logical arguments. Students will apply and adapt a variety of appropriate strategies to solve mathematical problems. Students will recognize and apply mathematics in contexts outside of mathematics. Students will organize and consolidate mathematical thinking through written and oral communication. Students will integrate transcendental functions, including logarithms, exponential, trigonometry and inverse trigonometric, hyperbolic and inverse hyperbolic functions, apply methods of integration, such as algebraic substitution, trigonometric substitution, partial fractions, integration by parts, and use a table of integrals, solve limit problems involving indeterminate forms with La'Hopital's Rule and convert parametric representation of curves to rectangular coordinates, represent a curve using polar coordinates, and integrate functions expressed in polar coordinates.

### Contents

- 1 Techniques of integration: Using Basic Integration Formulas, Integration by Parts
- 2 Trigonometric Integrals, Trigonometric Substitutions
- 3 Integration of Rational Functions by Partial Fractions
- 4 Integral Tables & Computer Algebra Systems, Numerical Integration, Improper Integrals
- 5 Sequences & Infinite Series, The Integral Test, Comparison Tests
- 6 Absolute Convergence, The Ratio & Root Tests
- 7 Alternating Series & Conditional Convergence
- 8 Power Series, Taylor & Maclaurin Series, Convergence of Taylor Series
- 9 The Binomial Series & Applications of Taylor Series
- 10 Parametrizations of Plane Curves
- 11 Calculus with Parametric Curves, Polar Coordinates
- 12 Graphing Polar Coordinate Equations
- 13 Areas & Lengths in Polar Coordinates, Conic Sections, Conics in Polar Coordinates

*Pre-requisite:* Calculus-I

### Recommended Texts

Linear algebra is the study of linear systems of equations, vector spaces, and linear transformations. Solving systems of linear equations is a basic tool of many mathematical procedures used for solving problems in science and engineering. Linear Algebra plays a significant role in many areas of mathematics, statistics, engineering, the natural sciences, and the computer sciences. It provides a foundation of important mathematical ideas that will help students be successful in future coursework. The main objective of this course is to help students to learn in rigorous manner, the tools & methods essential for studying the solution spaces of problems in mathematics and in other fields & develop mathematical skills needed to apply these to the problems arising within their field of study and to various real-world problems. The student will become competent in solving linear equations, performing matrix algebra, calculating determinants, finding eigenvalues & eigenvectors and the student will come to understand a matrix as a linear transformation relative to a basis of a vector space.

### Contents

- 1 Representation of linear equations in matrix form
- 2 Solution of linear system, Gauss-Jordan & Gaussian elimination method
- 3 Vector space, definition, examples & properties
- 4 Subspaces, Linear combination & spanning set
- 5 Linearly Dependent & Linearly Independent sets
- 6 Bases & dimension of a vector space
- 7 Intersections, sums & direct sums of subspaces, Quotient Spaces, Change of basis
- 8 Linear transformation, Rank & Nullity of linear transformation
- 9 Matrix of linear transformations
- 10 Eigen values & eigen vectors, Dual spaces
- 11 Inner product Spaces with properties, Projection
- 12 Cauchy inequality
- 13 Orthogonal & orthonormal basis
- 14 Gram Schmidt process & diagonalization

2. Anton, H., & Rorres, C. (2014). *Elementary linear algebra: applications version* (11<sup>th</sup> ed.). New York: John Wiley & Sons.
3. Grossman, S. I. (2004). *Elementary linear algebra* (5<sup>th</sup> ed.). New York: Cengage Learning.

This course shall assume background in calculus. This course introduces the fundamental principles in mechanics. Structural design applications of a variety of problems are developed throughout the course using examples that elucidate the theory of mechanics. It emphasizes on the laws of friction, equilibrium, center of gravity & harmonic & orbital motion. The objectives of the course are to develop better understanding of key concepts concerning scalar and vector fields learned previously in Multivariable Calculus courses, to gain deeper knowledge of multivariate differentiation operations such as Gradient, Divergent and Curl, master the Integral Theorems at the core of Vector Analysis: the Stokes (Greens') Theorem and the Divergence (Gauss') Theorem and to learn the utility of Vector Analysis by learning its relevance to Maxwell's equations describing the dynamics of electric and magnetic fields. In this course, students are prepared for further study in the relevant technological disciplines and more advanced mathematics courses.

### Contents

- 1 Mechanics: Composition & resolution of co-planar forces, Moments
- 2 Couples & conditions of equilibrium under the action of co-planar forces
- 3 Frictional forces, Laws of friction
- 4 Equilibrium of bodies on rough surfaces
- 5 Principle of virtual work & related problems
- 6 Center of gravity, Center of mass of various bodies
- 7 Kinematics of a particle in Cartesian & polar co-ordinates
- 8 Linear & angular velocity
- 9 Rectilinear motion with uniform & variable acceleration
- 10 Simple harmonic motion
- 11 Projectile motion
- 12 Motion along horizontal & vertical circles

This is the third course of the basic sequence Calculus-1, II & III, serving as the foundation of advanced subjects in all areas of mathematics. It focuses on the study of functions of a multivariable. The main focus of the course is to the study of multiple integrals in different coordinate systems & their applications. Moreover, a brief introduction to vector calculus will also be presented.

### Contents

- 1 Vectors & analytic geometry in space: Three-dimensional Coordinate System
- 2 Vectors, lines & planes in space
- 3 The dot product, the cross product
- 4 Cylinder & Quadric surfaces, vector-valued functions
- 5 Vector functions & space curve
- 6 Derivatives & integrals of vector functions
- 7 Arc length & Curvature
- 8 Motion in space, Velocity & Acceleration
- 9 Tangential & Normal Components of Acceleration
- 10 Velocity & Acceleration in Polar Coordinates
- 11 Functions of several variables, limits, Continuity & partial derivatives
- 12 Chain rule, directional derivatives & the gradient vector
- 13 Maximum & minimum values, optimization problems, Lagrange Multipliers
- 14 Multiple integrals: Double integrals over rectangles & iterated integrals
- 15 Double integrals over general regions
- 16 Double integrals in polar coordinates
- 17 Triple integrals in rectangular, cylindrical & spherical coordinates
- 18 Applications of double & triple integrals, Change of variables in multiple integrals
- 19 Vector calculus: Vector fields, line integrals, The fundamental theorem of Line Integrals
- 20 Green's theorem, Curl & divergence
- 21 Surface integrals over scalar & vector fields
- 22 Divergence theorem, Stokes' theorem

*Pre-requisite: Calculus-II*

This course is an introduction to group theory, one of the three main branches of pure mathematics. Group theory is the study of groups. Group theory is one of the great simplifying and unifying ideas in modern mathematics. It was introduced in order to understand the solutions to polynomial equations, but only in the last one hundred years has its full significance, as a mathematical formulation of symmetry, been understood. It plays a role in our understanding of fundamental particles, the structure of crystal lattices and the geometry of molecules. In this course, we will begin by defining the axioms satisfied by groups and begin to develop basic group theory by reference to some elementary examples. We will analyse the structure of 'small' finite groups, and examine examples arising as groups of permutations of a set, symmetries of regular polygons and regular solids, and groups of matrices. We will develop the notions of homomorphism, normal subgroups and quotient groups and study the First Isomorphism Theorem and its application.

### Contents

- 1 Groups, definition & examples of groups, elementary properties of groups
- 2 Finite & Infinite Groups
- 3 Order of element of a group & related results
- 4 Subgroups, examples of subgroup, subgroup tests, subgroup generated by set
- 5 Cyclic groups, properties of cyclic groups
- 6 Classification of subgroups of cyclic groups
- 7 Cosets decomposition of a group, properties of cosets
- 8 Lagrange's theorem & its consequences
- 9 Conjugate elements & conjugacy classes
- 10 Centralizer of a subset of a group, normalizer of a subset of a group
- 11 Center of group definition & examples
- 12 Normal Subgroups, factor groups, application of factor groups
- 13 Permutations & Permutation groups, definition & examples
- 14 Homomorphism of groups, properties of Homomorphisms
- 15 Fundamental theorem of homomorphism
- 16 Isomorphism theorems, properties of Isomorphisms & Cayley's theorem
- 17 Endomorphism & automorphisms of groups, Commutator subgroups
- 18 External & Internal direct products, definition & examples

This course introduces the theory, solution, & application of ordinary differential equations. Topics discussed in the course include methods of solving first-order differential equations, existence & uniqueness theorems, second-order linear equations, power series solutions, higher-order linear equations, systems of equations, non-linear equations, Sturm-Liouville theory, & applications. The relationship between differential equations & linear algebra is emphasized in this course. An introduction to numerical solutions is also provided. Applications of differential equations in physics, engineering, biology, & economics are presented. The goal of this course is to provide the student with an understanding of the solutions & applications of ordinary differential equations. The course serves as an introduction to both nonlinear differential equations & provides a prerequisite for further study in those areas.

### Contents

- 1 Introduction to differential equations: Preliminaries & classification of differential equations
- 2 Verification of solution, existence of unique solutions, introduction to initial value problems
- 3 Basic concepts, formation & solution of first order ordinary differential equations
- 4 Separable equations, linear equations, integrating factors, Exact Equations
- 5 Solution of nonlinear first order differential equations by substitution, Homogeneous Equations,
- 6 Bernoulli equation, Riccati's equation & Clairaut equation
- 7 Modeling with first-order ODEs: Linear models, Nonlinear models
- 8 Higher order differential equations: Initial value & boundary value problems
- 9 Homogeneous & non-homogeneous linear higher order ODEs & their solutions, Wronskian,
- 10 Reduction of order, homogeneous equations with constant coefficients,
- 11 Nonhomogeneous equations, undetermined coefficients method, Superposition principle
- 12 Annihilator approach, variation of parameters, Cauchy-Euler equation,
- 13 Solving system of linear differential equations by elimination
- 14 Solution of nonlinear differential equations
- 15 Power series, ordinary & singular points & their types, existence of power series solutions
- 16 Frobenius theorem, existence of Frobenius series solutions
- 17 The Bessel, Modified Bessel, Legendre & Hermite equations & their solutions
- 18 Sturm-Liouville problems: Introduction to eigen value problem, adjoint & self-adjoint operators,
- 19 Self-adjoint differential equations, eigen values & eigen functions
- 20 Sturm-Liouville (S-L) boundary value problems, regular & singular S-L problems

This course is continuation of the course series of Algebra, which builds on the concepts learnt in Algebra-I. This course is an introduction to ring theory. The philosophy of this subject is that we focus on similarities in arithmetic structure between sets (of numbers, matrices, functions or polynomials for example) which might look initially quite different but are connected by the property of being equipped with operations of addition and multiplication. Much of the activity that led to the modern formulation of ring theory took place in the first half of the 20th century. Ring theory is powerful in terms of its scope and generality, but it can be simply described as the study of systems in which addition and multiplication are possible. The objectives of the course are to introduce students to the basic ideas & methods of modern algebra & enable them to understand the idea of a ring & an integral domain, & be aware of examples of these structures in mathematics; appreciate & be able to prove the basic results of ring theory; The topics covered include ideals, quotient rings, ring homomorphism, the Euclidean algorithm & the principal ideal domains.

### Contents

- 1 Rings: Definition, examples. Quadratic integer rings
- 2 Examples of non-commutative rings
- 3 The Hamilton quaternions
- 4 Polynomial rings
- 5 Matrix rings. Units, zero-divisors
- 6 Nilpotents, idempotents. Subrings, Ideals
- 7 Maximal & prime Ideals. Left, right & two-sided ideals; Operations with ideals
- 8 The ideal generated by a set. Quotient rings. Ring homomorphism
- 9 The isomorphism theorems, applications
- 10 Finitely generated ideals
- 11 Rings of fractions
- 12 Integral Domain: The Chinese remainder theorem. Divisibility in integral domains
- 13 Greatest common divisor, least common multiple
- 14 Euclidean domains, the Euclidean algorithm, Principal ideal domains
- 15 Prime & irreducible elements in an integral domain
- 16 Gauss lemma, irreducibility criteria for polynomials

*Pre-requisite:* Algebra-I

This is an introductory course in discrete mathematics. Discrete Mathematics is study of distinct, un-related topics of mathematics; it embraces topics from early stages of mathematical development & recent additions to the discipline as well. It is the study of mathematical structures that are fundamentally discrete rather than continuous. In contrast to real numbers that have the property of varying "smoothly", the objects studied in discrete mathematics, such as integers, graphs, & statements in logic. The goal of this course is to introduce students to ideas and techniques from discrete mathematics that are widely used in science and engineering. This course teaches the students techniques in how to think logically and mathematically and apply these techniques in solving problems. To achieve this goal, students will learn logic and proof, sets, functions, as well as algorithms and mathematical reasoning. Key topics involving relations, graphs, trees, and formal languages and computability are covered in this course. The present course restricts only to counting methods, relations & graphs. The objective of the course is to inculcate in the students the skills that are necessary for decision making in non-continuous situations.

### Contents

- 1 Counting methods: Basic methods: product
- 2 inclusion-exclusion formulae
- 3 Permutations & combinations
- 4 Recurrence relations & their solutions
- 5 Generating functions
- 6 Double counting & its applications
- 7 Pigeonhole principle & its applications
- 8 Relations: Binary relations, n-ary Relations, closures of relations
- 9 Composition of relations, inverse relation
- 10 Graphs: Graph terminology
- 11 Representation of graphs
- 12 Graphs isomorphism
- 13 Algebraic methods: the incidence matrix, connectivity
- 14 Eulerian & Hamiltonian paths, shortest path problem
- 15 Trees & spanning trees, Complete graphs & bivalent graphs

Number theory (or arithmetic or higher arithmetic in older usage) is a branch of pure mathematics devoted primarily to the study of the integers & integer-valued functions. Integers can be considered either in themselves or as solutions to equations (Diophantine geometry). There are two subfields of number theory. One is Analytical Number Theory and other is Algebraic number theory. The focus of the course is on study of the fundamental properties of integers & develops ability to prove basic theorems. The specific objectives include study of division algorithm, prime numbers & their distributions, Diophantine equations & the theory of congruences. Students will learn about the arithmetic of algebraic number fields. They will learn to prove theorems about integral bases, & about unique factorization into ideals. They will learn to calculate class numbers, & to use the theory to solve simple Diophantine equations.

### Contents

- 1 Divisibility
- 2 Euclid's theorem
- 3 Congruences, Elementary properties
- 4 Residue classes & Euler's function
- 5 Linear congruence & congruence of higher degree
- 6 Congruences with prime moduli
- 7 The theorems of Fermat
- 8 Euler & Wilson theorem
- 9 Primitive roots & indices
- 10 Integers belonging to a given exponent
- 11 Composite moduli Indices
- 12 Quadratic Residues
- 13 Composite moduli
- 14 Legendre symbol
- 15 Law of quadratic reciprocity, The Jacobi symbol
- 16 Number-Theoretic Functions
- 17 Mobius function
- 18 The function  $[x]$
- 19 Diophantine Equations
- 20 Equations & Fermat's conjecture for  $n = 2, n = 4$

This is the first part of a two-semester course. This course covers the fundamentals of mathematical analysis: convergence of sequences & series, continuity, differentiability, Riemann integral, sequences & series of functions, uniformity, & the interchange of limit operations. It shows the utility of abstract concepts & teaches an understanding & construction of proofs. It develops the fundamental ideas of analysis & is aimed at developing the student's ability to describe the real line as a complete, ordered field, to use the definitions of convergence as they apply to sequences, series, & functions, to determine the continuity, differentiability & integrability of functions defined on subsets of the real line, to write solutions to problems & proofs of theorems that meet rigorous standards based on content, organization & coherence, argument & support, & style & mechanics, to determine the Riemann integrability of a bounded function & prove a selection of theorems concerning integration, to recognize the difference between point wise & uniform convergence of a sequence of functions & to illustrate the effect of uniform convergence on the limit function with respect to continuity, differentiability, & integrability.

### Contents

- 1 Number Systems: Ordered fields
- 2 rational, real & complex numbers
- 3 Archimedean property
- 4 supremum, infimum & completeness
- 5 Topology of real numbers
- 6 Convergence, completeness, completion of real numbers
- 7 Heine Borel theorem
- 8 Sequences & Series of Real Numbers
- 9 Limits of sequences, algebra of limits
- 10 Bolzano Weierstrass theorem, Cauchy sequences,  $\liminf$ ,  $\limsup$
- 11 limits of series, convergences tests, absolute & conditional convergence, power series
- 12 Continuity: Functions, continuity & compactness, existence of minimizers & maximizers
- 13 uniform continuity, continuity & connectedness, intermediate mean value theorem
- 14 monotone functions & discontinuities
- 15 Differentiation: Mean value theorem, L'Hopital's Rule, Taylor's theorem

Topology studies continuity in its broadest context. We begin by analyzing the notion of continuity familiar from calculus, showing that it depends on being able to measure distance in Euclidean space. This leads to the more general notion of a metric space. A brief investigation of metric spaces shows that they do not provide the most suitable context for studying continuity. A deeper analysis of continuity in metric spaces shows that only the open sets matter, which leads to the notion of topological spaces. We easily see that this is the right setting for studying continuity. The central concepts of topology, compactness, connectedness & separation axioms are introduced. Applications of topology to number theory, algebraic geometry, algebra & functional analysis are featured. Since many important applications of topology use metric spaces, we investigate topological concepts applied to them & introduce the notion of completeness. In addition, this course provides the basis for studying differential geometry, functional analysis, classical & quantum mechanics, dynamical systems, algebraic & differential topology.

### Contents

- 1 Topological spaces
- 2 Bases & sub-bases
- 3 First & second axiom of countability
- 4 Separability
- 5 Continuous functions & homeomorphism
- 6 Finite product space
- 7 Separation axioms ( $T_0$ )
- 8 Separation axioms ( $T_1$ )
- 9 Separation axioms ( $T_2$ )
- 10 Techonoff spaces
- 11 Regular spaces
- 12 Completely regular spaces
- 13 Normal spaces
- 14 Product spaces
- 15 Compactness
- 16 Connectedness

Differential geometry is the study of geometric properties of curves, surfaces, & their higher dimensional analogues using the methods of calculus. It has a long & rich history, &, in addition to its intrinsic mathematical value & important connections with various other branches of mathematics, it has many applications in various physical sciences, e.g., solid mechanics, computer tomography, or general relativity. Differential geometry is a vast subject. This course covers many of the basic concepts of differential geometry in the simpler context of curves & surfaces in ordinary 3-dimensional Euclidean space. The aim is to build both a solid mathematical understanding of the fundamental notions of differential geometry & enough visual & geometric intuition of the subject. This course is of interest to students from a variety of math, science & engineering backgrounds, & that after completing this course, the students will be ready to study more advanced topics such as global properties of curves & surfaces, geometry of abstract manifolds, tensor analysis, & general relativity.

### Contents

- 1 Space Curves
- 2 Arc length, tangent
- 3 Normal & binormal
- 4 Curvature & torsion of a curve
- 5 Tangent planes
- 6 The Frenet-Serret apparatus
- 7 Fundamental existence theorem of plane curves
- 8 Four vertex theorem, Isoperimetric inequality
- 9 Surfaces
- 10 First fundamental form
- 11 Isometry & conformal mappings
- 12 Curves on Surfaces, surface Area
- 13 Second fundamental form
- 14 Normal & Principle curvatures
- 15 Gaussian & Mean curvatures
- 16 Geodesics

Mathematical methods presents an applied mathematics course designed to provide the necessary analytical and numerical background for courses in astrophysics, plasma physics, fluid dynamics, electromagnetism, and radiation transfer. The main objective of this course is to provide the students with a range of mathematical methods that are essential to the solution of advanced problems encountered in the fields of applied physics & engineering. Calculation-oriented mathematics is included in all topics relevant. Systems of linear equations, Gauss-Jordan-elimination, basic matrix algebra, determinants. Limits and continuity, differentiation and integration of functions in one variable, maxima and minima, implicit differentiation and trigonometric functions, related rates, differentials and linearization, L'Hopitals rule, Newton's method and the bisection method. Riemannsums and the fundamental theorem in calculus, integral functions, definite and indefinite integrals, basic integration techniques, substitution and partial integration, numerical integration by the rectangle and trapezium methods, improper integrals. Area, volume and arc length. Modeling with differential equations, first order separable and linear differential equations, Euler's method, second order linear differential equations with constant coefficients.

### Contents

- 1 Fourier Methods: The Fourier transforms
- 2 Fourier analysis of the generalized functions
- 3 The Laplace transforms
- 4 Hankel transforms for the solution of PDEs & their application to boundary value problems
- 5 Green's Functions & Transform Methods: Expansion for Green's functions
- 6 Transform methods. Closed form Green's functions. Perturbation Techniques
- 7 Perturbation methods for algebraic equations
- 8 Perturbation methods for differential equations
- 9 Variational Methods: Euler-Lagrange equations
- 10 Integr & involving one, two, three & n variables
- 11 Special cases of Euler-Lagrange's equations
- 12 Necessary conditions for existence of an extremum of a functional
- 13 Constrained maxima & minima

This course is continuation of Real Analysis I, this course will continue to cover the fundamentals of real analysis, concentrating on the Riemann-Stieltjes integrals, Functions of Bounded Variation, Improper Integrals, & convergence of series. Emphasis would be on proofs of main results. The aim of this course is also to provide an accessible, reasonably paced treatment of the basic concepts & techniques of real analysis for students in these areas. This course provides greatly strengthening student's understanding of the results of calculus & the basis for their validity the uses of deductive reasoning, increasing the student's ability to understand definitions, understand proofs, analyze conjectures, find counter-examples to false statements, construct proofs of true statements & enhancing the student's mathematical communication skills.

### *Contents*

- 1 The Riemann-Stieltjes Integrals
- 2 Definition & existence of integrals
- 3 Properties of integrals
- 4 Fundamental theorem of calculus & its applications
- 5 Change of variable theorem, integration by parts
- 6 Functions of Bounded Variation
- 7 Definition & examples, properties of functions of bounded variation
- 8 Improper Integrals: Types of improper integrals
- 9 Tests for convergence of improper integrals
- 10 Beta & gamma functions
- 11 Absolute & conditional convergence of improper integrals
- 12 Sequences & Series of Functions
- 13 Power series, definition of point wise & uniform convergence
- 14 Uniform convergence & continuity
- 15 Uniform convergence & differentiation, examples of uniform convergence

*Pre-requisite:* Real Analysis-I

The purpose of this course is to provide solid understanding of classical mechanics & enable the students to use this understanding while studying courses on quantum mechanics, statistical mechanics, electromagnetism, fluid dynamics, space-flight dynamics, astrodynamics & continuum mechanics. The course aims at familiarizing the students with the dynamics of system of particles, kinetic energy, motion of rigid body, Lagrangian & Hamiltonian formulation of mechanics. At the end of this course the students will be able to understand the fundamental principles of classical mechanics, to master concepts in Lagrangian & Hamiltonian mechanics important to develop solid & systematic problem solving skills. To lay a solid foundation for more advanced study of classical mechanics & quantum mechanics.

### Contents

- 1 Work, power, kinetic energy & energy principle
- 2 conservative force fields, conservation of energy theorem, impulse
- 3 Conservation of linear & angular momentum
- 4 Time varying mass systems (Rockets)
- 5 Introduction to rigid bodies
- 6 Translations & rotations
- 7 Linear & angular velocity of a rigid body about a fixed axis
- 8 Angular momentum for n particles
- 9 Rotational kinetic energy
- 10 Moments & products of inertia
- 11 Parallel & perpendicular axes theorem
- 12 Principal axes & principal moments of inertia. Determination of principal axes by diagonalizing the inertia matrix
- 13 Equipmental systems
- 14 Coplanar distribution
- 15 Rotating axes theorem
- 16 Euler's dynamical equations of motion. Free rotation of a rigid body with three different principal moments, torque free motion of a symmetrical top
- 17 The Eulerian angles, angular velocity & kinetic energy in terms of Euler angles

This is an introductory course in complex analysis, giving the basics of the theory along with applications, with an emphasis on applications of complex analysis & especially conformal mappings. Students should have a background in real analysis (as in the course Real Analysis I), including the ability to write a simple proof in an analysis context. Complex Analysis is a topic that is extremely useful in many applied topics such as numerical analysis, electrical engineering, physics, chaos theory, & much more, & you will see some of these applications throughout the course. In addition, complex analysis is a subject that is, in a sense, very complete. The concept of complex differentiation is much more restrictive than that of real differentiation & as a result the corresponding theory of complex differentiable functions is a particularly nice one.

### *Contents*

- 1 Introduction: The algebra of complex numbers
- 2 Geometric representation of complex numbers
- 3 Polar form of complex numbers
- 4 Powers & roots of complex numbers
- 5 Functions of Complex Variables
- 6 Limit
- 7 Continuity
- 8 Differentiable functions, the Cauchy-Riemann equations
- 9 Analytic functions, entire functions, harmonic functions
- 10 Elementary functions: The exponential, Trigonometric functions
- 11 Hyperbolic, Logarithmic & Inverse elementary functions
- 12 Complex Integrals: Contours & contour integrals, anti-derivatives, independence of path
- 13 Cauchy-Goursat theorem, Cauchy integral formula, Liouville's theorem, Morera's theorem
- 14 Maximum Modulus Principle
- 15 Series: Power series, Radius of convergence & analyticity
- 16 Taylor's & Laurent's series
- 17 Integration & differentiation of power series, isolated singular points
- 18 Cauchy's residue theorem with applications
- 19 Types of singularities & calculus of residues, Zeros & Poles, Mobius transforms
- 20 Conformal mappings & transformations

- 2 Rudin, W. (1987). *Real & complex analysis* (3<sup>rd</sup> ed.). New York: McGraw-Hill.

This course extends methods of linear algebra & analysis to spaces of functions, in which the interaction between algebra & analysis allows powerful methods to be developed. The course will be mathematically sophisticated & will use ideas both from linear algebra & analysis. This is a basic graduate level course that introduces the student to Functional Analysis & its applications. It starts with a review of the theory of metric spaces, the theory of Banach spaces & proceeds to develop some key theorems of functional analysis. Then continuous to linear operators in Banach & Hilbert spaces & to spectral theory of self-adjoint operators with applications to the theory of boundary value problems, & the theory of linear elliptic partial differential equations.

### *Contents*

- 1 Metric Spaces
- 2 Convergence
- 3 Cauchy's sequences & examples
- 4 Completeness of metric space
- 5 Completeness proofs
- 6 Normed linear Spaces, Banach Spaces
- 7 Equivalent norms
- 8 Linear operators
- 9 Finite dimensional normed spaces
- 10 Continuous & bounded linear operators
- 11 Linear functional, Dual spaces
- 12 Linear operator & functional on finite dimensional Spaces
- 13 Inner product Spaces
- 14 Hilbert Spaces
- 15 Conjugate spaces
- 16 Representation of linear functional on Hilbert space
- 17 Orthogonal sets
- 18 Orthonormal sets & sequences
- 19 Orthogonal complements & direct sum
- 20 Reflexive spaces

### *Recommended Texts*

- 2 Balakrishnan, A. V. (1981). *Applied functional analysis* (2<sup>nd</sup> ed.). New York: Springer-Verlag.
- 3 Conway, J. B. (1995). *A Course in functional analysis* (2<sup>nd</sup> ed.). New York: Springer-Verlag.

This course is designed to teach the students about numerical methods & their theoretical bases. The course aims at inculcating in the students the skill to apply various techniques in numerical analysis, understand & do calculations about errors that can occur in numerical methods & understand & be able to use the basics of matrix analysis. It is optimal to verifying numerical methods by using computer programming (MatLab, Maple, C++, etc.)

### Contents

- 1 Error analysis: Floating point arithmetic, Approximations & errors
- 2 Methods for the solution of nonlinear equations
- 3 Bisection method, regula-falsi method, Fixed point iteration method
- 4 Newton-Raphson method, secant method, error analysis for iterative methods
- 5 Interpolation & polynomial approximation
- 6 Forward, backward & centered difference formulae
- 7 Lagrange interpolation, Newton's divided difference formula
- 8 Interpolation with a cubic spline, Hermite interpolation, Least squares approximation
- 9 Numerical differentiation & Integration: Forward, backward & central difference formulae
- 10 Richardson's extrapolation, Newton-Cotes formulae, Numerical integration
- 11 Rectangular rule, trapezoidal rule, Simpson's 1/3 & 3/8 rules
- 12 Boole's & Weddle's rules, Gaussian quadrature
- 13 Numerical solution of a system of linear equations
- 14 Direct methods: Gaussian elimination method
- 15 Gauss-Jordan method; matrix inversion; LU-factorization
- 16 Doolittle's, Crout's & Cholesky's methods
- 17 Iterative methods: Jacobi, Gauss-Seidel & SOR
- 18 Eigen values problems
- 19 Introduction, Power Method, Jaccobi's Method
- 20 The use of software packages/ programming languages for above mentioned topics is recommended

Partial Differential Equations (PDEs) are in the heart of applied mathematics & many other scientific disciplines. The beginning weeks of the course aim to develop enough familiarity & experience with the basic phenomena, approaches, & methods in solving initial/boundary value problems in the contexts of the classical prototype linear PDEs of constant coefficients: the Laplace equation, the wave equation & the heat equation. A variety of tools & methods, such as Fourier series/eigen function expansions, Fourier transforms, energy methods, & maximum principles will be introduced. More importantly, appropriate methods are introduced for the purpose of establishing quantitative as well as qualitative characteristic properties of solutions to each class of equations

### Contents

- 1 First order PDEs: Introduction, Formation of PDEs, Solutions of PDEs of first order
- 2 The Cauchy's problem for quasi linear first order PDEs, First order nonlinear equations
- 3 Special types of first order equations Second order PDEs
- 4 Basic concepts & definitions, Mathematical problems, Linear operator
- 5 Superposition, Mathematical models
- 6 The classical equations, The vibrating string, The vibrating membrane
- 7 Conduction of heat solids, Canonical forms & variable
- 8 PDEs of second order in two independent variables with constant & variable coefficients
- 9 Cauchy's problem for second order PDEs in two independent variables
- 10 Methods of separation of variables, Solutions of elliptic
- 11 Parabolic & hyperbolic PDEs in Cartesian & cylindrical coordinates
- 12 Laplace transform: Introduction & properties of Laplace transform
- 13 Transforms of elementary functions, Periodic functions, error functions
- 14 Dirac delta function, Inverse Laplace transform, Convolution Theorem
- 15 Solution of PDEs by Laplace transform, Diffusion & wave equations
- 16 Fourier transforms, Fourier integral representation
- 17 Fourier sine & cosine representation, Fourier transform pair
- 18 Transform of elementary functions & Dirac delta function, Finite Fourier transforms
- 19 Solutions of heat, Wave & Laplace equations by Fourier transforms

This course is designed to teach the students about numerical methods & their theoretical bases. The main purpose of this course is to learn the concepts of numerical methods in solving mathematical problems numerically & analyze the error for these methods. The students are expected to know computer programming to be able to write program for each numerical method. Knowledge of calculus & linear algebra would help in learning these methods. The students are encouraged to read certain books containing some applications of numerical methods.

### Contents

- 1 Difference & Differential equation
- 2 Formulation of difference equations
- 3 Solution of linear/non-linear difference equations with constant coefficients
- 4 Solution of homogeneous difference equations with constant coefficients
- 5 Solution of inhomogeneous difference equations with constant coefficients
- 6 The Euler method
- 7 The modified Euler method
- 8 Runge-Kutta methods
- 9 Predictor-corrector type methods for solving initial value problems along with convergence
- 10 Predictor-corrector type methods for solving initial value problems along with instability criteria
- 11 Runge-Kutta methods for solving initial value problems
- 12 Predictor-corrector type methods for solving initial value problems.
- 13 Convergence criteria
- 14 Instability criteria
- 15 Finite difference methods
- 16 Collocation methods for boundary value problems
- 17 Variational methods for boundary value problems

*Pre-requisite: Numerical Analysis-I*

Many physical problems that are usually solved by differential equation methods can be solved more effectively by integral equation methods. This course will help students gain insight into the application of advanced mathematics & guide them through derivation of appropriate integral equations governing the behavior of several standard physical problems. In addition, a large class of initial & boundary value problems, associated with the differential equations, can be reduced to the integral equations, whence enjoy the advantage of the above integral presentations. This course has many applications in many sciences. This course emphasizes concepts and techniques for solving integral equations from an applied mathematics perspective. Material is selected from the following topics: Volterra and Fredholm equations, Fredholm theory, the Hilbert-Schmidt theorem; Wiener-Hopf Method; Wiener-Hopf Method and partial differential equations; the Hilbert Problem and singular integral equations of Cauchy type; inverse scattering transform; and group theory. Examples are taken from fluid and solid mechanics, acoustics, quantum mechanics, and other applications.

### Contents

- 1 Linear integral equations of the first kind
- 2 Linear integral equations of the second kind
- 3 Relationship between differential equation & Volterra integral equation
- 4 Neumann series
- 5 Fredholm Integral equation of the second kind with separable Kernels
- 6 Eigen values, Eigenvectors
- 7 Iterated functions
- 8 Quadrature methods
- 9 Least square methods
- 10 Homogeneous integral equations of the second kind
- 11 Fredholm integral equations of the first kind
- 12 Fredholm integral equations of the second kind
- 13 Abel's integral equations
- 14 Hilbert Schmidt theory of integral equations with symmetric Kernels
- 15 Regularization & filtering techniques

Special functions are particular mathematical functions that have more or less established names & notations due to their importance in mathematical analysis, functional analysis, geometry, physics, or other applications. The term is defined by consensus, & thus lacks a general formal definition, but the List of mathematical functions contains functions that are commonly accepted as special. The main aim of this course is the study of basic special functions & proves the properties & relations related to these functions. Furthermore, the simple sets of polynomials are discussed.

### Contents

- 1 The Weierstrass gamma function
- 2 Euler integral representation of gamma function
- 3 Relations satisfied by gamma function
- 4 Euler's constant
- 5 The order symbols  $o$  &  $O$
- 6 Properties of gamma function
- 7 Beta function, integral representation of beta function
- 8 Relation between gamma & beta functions
- 9 Properties of beta function, Legendre's duplication formula
- 10 Gauss' multiplication theorem
- 11 Hypergeometric series, the functions  $F(a,b;c;z)$  &  $F(a,b;c;1)$ , integral representation of hypergeometric function,
- 12 The hypergeometric differential equation, The contiguous relations, Simple transformations,
- 13 A theorem due to Kummer,
- 14 Confluent hypergeometric series, Integral representation of confluent hypergeometric function, the confluent hypergeometric,
- 15 Differential equation, Kummer's first formula
- 16 Simple sets of polynomials, Orthogonality,
- 17 The three term recurrence relation, The Christoffel-Darboux formula,
- 18 Normalization, Bessel's inequality
- 19 Generating functions
- 20 Differential equations
- 21 Recurrence relations.

The objective of this course is to understand & apply the fundamental concepts in graph theory, apply graph theory-based tools in solving practical problems & to improve the proof writing skills. Graph theory has been applied to several areas of physics, chemistry, communication science, biology, electrical engineering, operations research, psychology, linguistics, among others fields, to solve problems that can be modeled as discrete objects called graphs. Graph theory is intimately related to different branches of mathematics including the group theory, the matrix theory, the numerical analysis, probability, topology, & the combinatorics. Even though some of the problems in graph theory can be described in an elementary way, many of these problems represent a challenge to many researchers in mathematics. The main focus of this course is to understand & apply the fundamental concepts in graph theory. To apply graph theory-based tools in solving practical problems. To improve the proof writing skills.

### *Contents*

- 1 Graphs & digraphs
- 2 Degree sequences
- 3 Paths
- 4 Cycles, cut-vertices, & blocks
- 5 Eulerian graph
- 6 Digraphs
- 7 Trees
- 8 Incidence matrix
- 9 Cut-matrix
- 10 Circuit matrix & adjacency matrix
- 11 Orthogonality relation
- 12 Decomposition
- 13 Euler formula
- 14 Planer graphs
- 15 Non-planer graphs
- 16 Mengers theorem
- 17 Hamiltonian's graphs

This is the first part of the two advance course series of Group Theory. This course aims to introduce students to some more sophisticated concepts & results of group theory as an essential part of general mathematical culture & as a basis for further study of more advanced mathematics. The ideal aim of Group Theory is the classification of all groups (up to isomorphism). It will be shown that this goal can be achieved for finitely generated abelian groups. In general, however, there is no hope of a similar result as the situation is far too complex, even for finite groups. Still, since groups are of great importance for the whole of mathematics, there is a highly developed theory of outstanding beauty. It takes just three simple axioms to define a group, & it is fascinating how much can be deduced from so little. The course is devoted to some of the basic concepts & results of Group Theory.

### Contents

- 1 Group of automorphisms, inner automorphisms, definition & related results
- 2 Characteristic & fully invariant subgroups,
- 3 Symmetric Groups, cyclic permutations
- 4 Even & odd permutations
- 5 The alternating groups, conjugacy classes of symmetric & alternating groups
- 6 Generators of symmetric & alternating groups
- 7 Simple groups
- 8 Simplicity of symmetric & alternating groups
- 9 Group Action on sets or G-sets
- 10 Orbits & stabilizer subgroups
- 11 Finite direct products
- 12 Finitely generated abelian groups
- 13 P-groups, Sylow's Theorems
- 14 Application of Sylow's Theorems
- 15 Linear Groups
- 16 Types of Linear Groups, Classical Groups

This course is the continuation of the course "Advanced Group Theory-1". This course aims to introduce students to some more sophisticated concepts & results of group theory as an essential part of general mathematical culture & as a basis for further study of more advanced mathematics. The ideal aim of Group Theory is the classification of all groups (up to isomorphism). It will be shown that this goal can be achieved for finitely generated abelian groups. This course covers the advanced topics in group theory such as solvable groups, Upper & Lower Central series nilpotent groups & free groups.

### *Contents*

- 1 Series in groups
- 2 Normal series
- 3 Normal series & its refinement
- 4 Composition series
- 5 Equivalent composition series
- 6 Jordan Holder Theorem
- 7 Solvable groups, definition, examples & related results
- 8 Upper & Lower Central series
- 9 Nilpotent groups
- 10 Characterization of finite nilpotent groups
- 11 The Frattini subgroups, definition, examples & related results
- 12 Free groups, definition, examples & related results
- 13 Free Product, definition, examples & related results
- 14 Group algebras
- 15 Representation modules

*Pre-requisite: Advance Group Theory-I*

The word “algebra” means many things. The word dates back about 1200 years ago to part of the title of al-Khwarizmi’s book on the subject, but the subject itself goes back 4000 years ago to ancient Babylonia & Egypt. This course introduces concepts of ring theory. The main objective of this course is to prepare students for courses which require a good back ground in Ring theory, Ring Homomorphism, basics Theorem etc. The focus of this course is the study of ideal theory & several domains in ring theory. Homework, graded homework, class quizzes, tests & a final exam will be used to assess the Student Learning Outcomes: Upon successful completion of the course, students will be able to: Demonstrate ability to think critically by interpreting theorems & relating results to problems in other mathematical disciplines. Demonstrate ability to think critically by recognizing patterns & principles of algebra & relating them to the number system. Work effectively with others to discuss homework problems put on the board. This will be assessed through class discussions.

### Contents

- 1 Polynomial rings
- 2 Division algorithm for polynomials
- 3 Prime elements
- 4 Irreducible elements
- 5 Euclidean domain
- 6 Principal ideal domain
- 7 Greatest common divisor
- 8 Prime & irreducible elements
- 9 Unique factorization domain
- 10 Factorization of polynomials over a UFD
- 11 Irreducibility of polynomials
- 12 Eisenstein’s irreducibility criterion
- 13 Maximal ideals
- 14 Prime ideals
- 15 Primary ideals
- 16 Noetherian rings
- 17 Artinian rings

### Recommended Texts

The word “algebra” means many things. The word dates back about 1200 years ago to part of the title of al-Khwarizmi’s book on the subject, but the subject itself goes back 4000 years ago to ancient Babylonia & Egypt. Modern algebra is a cornerstone of modern mathematics. This course introduces concepts of ring & group theory. The main objective of this course is to prepare students for courses which require a good background in Group Theory, Rings, Galois Theory, Symmetric group & permutation group etc. It is assumed that the students possess some mathematical maturity & are comfortable with writing proofs. After completing this course, student will be able to: Define & state some of the main concepts & theorems of Function Analysis. Apply their knowledge of subject in the investigation of examples. Prove basic proportions concerning functional analysis.

### *Contents*

- 1 Finite & finitely generated Abelian groups
- 2 Fields
- 3 Finite fields
- 4 Field extension
- 5 Galois theory
- 6 Galois theory of equations
- 7 Construction with straight-edge
- 8 Construction with compass
- 9 Splitting field of polynomials
- 10 The Galois groups
- 11 Some results on finite groups
- 12 Symmetric group as Galois group
- 13 Constructible regular n-gons
- 14 The Galois group as permutation group

*Pre-requisite: Modern Algebra-I*

The course gives an introduction to algebraic topology, with emphasis on the fundamental group and the singular homology groups of topological spaces. This course aims to understand some fundamental ideas in algebraic topology; to apply discrete, algebraic methods to solve topological problems; to develop some intuition for how algebraic topology relates to concrete topological problems. The primary aim of this course is to explore properties of topological spaces. We shall consider in detail examples such as surfaces. To distinguish topological spaces, we need to define topological invariants, such as the "fundamental group" or the "homology" of a space". To enable us to do this, knowledge of basic group theory & topology is essential. Some background in real analysis would also be helpful. After completing the course students can work with cell complexes and the basic notions of homotopy theory, know the construction of the fundamental group of a topological space, can use van Kampen's theorem to calculate this group for cell complexes and know the connection between covering spaces and the fundamental group.

### Contents

- 1 Affine spaces
- 2 Singular theory
- 3 Chain complexes
- 4 Homotopy invariance of homology
- 5 Relation between  $n$ , &  $H$
- 6 Relative homology
- 7 The exact homology sequences.
- 8 Nilpotent groups
- 9 Homotopy theory
- 10 Homotopy theory of path & maps
- 11 Fundamental group of circles
- 12 Covering spaces
- 13 Lifting criterion
- 14 Loop spaces
- 15 Higher homotopy group.
- 16 Loop spaces
- 17 Higher homotopy group.

This course is a continuation of Algebraic Topology-I. In this course, the objective is the study of knots, links, surfaces & higher dimensional analogs called manifolds with the understanding that continuous deformations do not change objects. So a doughnut (torus) & a coffee mug are essentially the same (homeomorphic) in this course. For example, how does a creature living on a sphere tell that she is not on the plane, on the torus, or perhaps a two holed torus? Can one turn a sphere inside out without creasing it? What would it be like to live inside a three dimensional sphere? Can one continuously deform a trefoil knot to get its mirror image? Can the wind be blowing at every point on the earth at once? Can you tell if a graph is planar? Can you tell if a knot is trivial? Is there a list of all possible two dimensional surfaces? How about three dimensional ones? These are some of the motivating questions for the subject. Algebraic topology attempts to answer such questions by assigning algebraic invariants such as numbers, or groups, to topological spaces. Examples include the Euler number of a surface, the Poincare index of a vector field, the genus of a torus, the fundamental group & more fancy homology groups.

### *Contents*

- 1 Relative homology
- 2 The exact homology sequences
- 3 Excision theorem & application to spheres
- 4 Mayer-Vietoris sequences
- 5 Jordan-Brouwer separation theorem
- 6 Spherical complexes
- 7 Betti number
- 8 Euler characteristic
- 9 Cell Complexes
- 10 Adjunction spaces

*Pre-requisite: Algebraic Topology-I*

This course is an introduction to module theory, for those who know something about linear algebra and ring theory. Its main aim is the derivation of the structure theory of modules over Euclidean domains. This theory is applied to obtain the structure of abelian groups and the rational canonical and Jordan normal forms of matrices. The basic facts about rings and modules are given in full generality, so that some further topics can be discussed, including projective modules and the connection between modules and representations of groups. It aims to develop the general theory of rings & then study in some detail a new concept, that of a module over a ring. The theory of rings & module is key to many more advanced algebra courses. This subject presents the foundational material for the last of the basic algebraic structure pervading contemporary pure mathematics, namely fields & modules. The basic definitions & elementary results are given, followed by two important applications of the theory. This course introduces concepts of modules. The main objective of this course is to prepare students for courses which require a good background in Modules Theory, Primary component & Invariance Theorem etc.

### Contents

- 1 Elementary notions & examples
- 2 Modules, sub modules, Quotient modules
- 3 Finitely generated & cyclic modules, Exact sequences
- 4 Elementary notions of homological algebra
- 5 Noetherian rings & modules
- 6 Artinian rings & modules, Radicals
- 7 Semisimple rings & modules
- 8 Tensor product of modules
- 9 Bimodules
- 10 Algebra & coalgebra
- 11 Torsion module
- 12 Primary components
- 13 Invariance theorem

This course will cover basics of abstract rings and fields, which are an important part of any abstract algebra course sequence. We will begin with definitions and important examples. We will focus cover prime, maximal ideals and important classes of rings like integral domains, UFDs and PIDs. We will also prove the Hilbert basis theorem about noetherian rings. The last 3-4 weeks will be devoted to field theory. We will give definitions, basic examples. Then we discuss extension of fields, adjoining roots, and prove the primitive element theorem. Finally, we will classify finite fields. Rings are one of the fundamental languages of mathematics & they play a key role in many areas, including algebraic geometry, number theory, Galois theory & representation theory. The aim of this module is to give an introduction to rings. The emphasis will be on interesting examples of rings & their properties. This course introduces concepts of ring theory. The main objective of this course is to prepare students for courses which require a good background in Ring theory, Ring Homomorphism, basics Theorem etc. The focus of this course is the study of ideal theory & several domains in ring theory.

### Contents

- 1 Definition of ring & basic concepts
- 2 Homomorphism theorems
- 3 Polynomial rings
- 4 Quotient rings
- 5 Unique factorization domain
- 6 Irreducibility of polynomials over UFD
- 7 Principal ideal domain
- 8 Factorization theory
- 9 Noetherian
- 10 Artinian rings
- 11 Euclidean domain
- 12 Arithmetic in Euclidean domain
- 13 Extension fields
- 14 Algebraic elements
- 15 transcendental elements
- 16 Simple extension

Electromagnetism is a branch of physics involving the study of the electromagnetic force, a type of physical interaction that occurs between electrically charged particles. The electromagnetic force is carried by electromagnetic fields composed of electric fields & magnetic fields, & it is responsible for electromagnetic radiation such as light. It is one of the four fundamental interactions (commonly called forces) in nature, together with the strong interaction, the weak interaction, & gravitation. At high energy the weak force & electromagnetic force are unified as a single electroweak force. Students will learn properties of coulomb's law, magnetic shells, conductivity & current density vector to flows.

### *Contents*

- 1 Electrostatics: Coulomb's law
- 2 Electric field & potential. lines of force & equipotential surfaces
- 3 Gauss's law & deduction
- 4 Conductor condensers
- 5 Dipoles, forces dipoles
- 6 Dielectrics, polarization & apparent charges
- 7 Electric displacement
- 8 Energy of the field, minimum energy
- 9 Magnetostatic field
- 10 The magnetostatic law of force, magnetic shells
- 11 Force on magnetic doublets
- 12 Magnetic induction, paradia & magnetism
- 13 Steady & slowly varying currents
- 14 Electric current
- 15 Linear conductors
- 16 Conductivity
- 17 Resistance
- 18 Kirchoff's laws
- 19 Heat production
- 20 Current density vector
- 21 Magnetic field of straight & circular current
- 22 Magnetic flux

### *Suggested Readings*

1. Pugh, M. E. (196). *Principles of electricity & magnetism* (1<sup>st</sup> ed.). Boston: Addison-Wesley.

This course is the continuation of the course Electromagnetism-I. The classical (non-quantum) theory of electromagnetism was first published by James Clerk Maxwell in his 1873 textbook *A Treatise on Electricity and Magnetism*. A host of scientists during the nineteenth century carried out the work that ultimately led to Maxwell's electromagnetism equations, which is still considered one of the triumphs of classical physics. Maxwell's description of electromagnetism, which demonstrates that electricity and magnetism are different aspects of a unified electromagnetic field, holds true today. Electromagnetism is a branch of physics involving the study of the electromagnetic force, a type of physical interaction that occurs between electrically charged particles. The electromagnetic force is carried by electromagnetic fields composed of electric fields & magnetic fields, & it is responsible for electromagnetic radiation such as light. It is one of the four fundamental interactions (commonly called forces) in nature, together with the strong interaction, the weak interaction, & gravitation. At high energy the weak force & electromagnetic force are unified as a single electroweak force. Students will learn properties of simple introduction to Legendre polynomials, method of images, images in a plane, images with spheres & cylinders.

### Contents

- 1 Vector potential
- 2 Forces on a circuit in magnetic field
- 3 Magnetic field energy, Law of electromagnetic induction
- 4 Co-efficient of self & mutual induction
- 5 Alternating current & simple I.C.R circuits in series & parallel
- 6 Power factor, the equations of electromagnetism
- 7 Maxwell's equations in free space & material media
- 8 Solution of Maxwell's equations
- 9 Plane electromagnetic waves in homogeneous & isotropic media
- 10 Reflection & refraction of plane waves
- 11 Wave guides Laplace' equation in plane, Polar & cylindrical coordinates
- 12 Simple introduction to Legendre polynomials
- 13 Method of images, images in a plane
- 14 Images with spheres & cylinders

*Pre-requisite:* Electromagnetism-I

This course is the first part of the core level course on fluid mechanics. Fluid mechanics is the branch of physics concerned with the mechanics of fluids (liquids, gases, & plasmas) & the forces on them. It has applications in a wide range of disciplines, including mechanical, civil, chemical & biomedical engineering, geophysics, oceanography, meteorology, astrophysics, & biology. The course of fluid mechanics is introducing fundamental aspects of fluid flow behavior. Students will learn properties of Newtonian fluids; apply concepts of mass, momentum & energy conservation to flows.

### Contents

- 1 Introduction: Definition of Fluid, basics equations
- 2 Methods of analysis, dimensions & units. Fundamental concepts
- 3 Fluid as a continuum, velocity field, stress field, viscosity, surface tension, description & classification of fluid motions
- 4 Fluid Statics: The basic equation of fluid static
- 5 The standard atmosphere
- 6 Pressure variation in a static fluid
- 7 Fluid in rigid body motion. Basic equation in integral form for a control volume
- 8 Basic laws for a system
- 9 Relation of derivatives to the control volume formulation
- 10 Conservation of mass
- 11 Momentum equation for inertial control volume
- 12 Momentum equation for control volume with rectilinear acceleration
- 13 Momentum equation for control volume with arbitrary acceleration
- 14 The angular momentum principle
- 15 The first law of thermodynamics
- 16 The second law of thermodynamics
- 17 Introduction to differential analysis of fluid motion
- 18 Conservation of mass
- 19 Stream function for two-dimensional incompressible flow
- 20 Motion of a fluid element (kinematics), momentum equation

### Recommended Texts

2. Bruce, R., Rothmayer, A. P., Theodore, H. O., & Wade, W. H. (2013). *Fundamental of fluid mechanics* (7<sup>th</sup> ed.). New York: Willey Son Publisher.
3. Nakayama, Y. (2018). *Introduction to fluid mechanics* (2<sup>nd</sup> ed.). Oxford: Butterworh Heinemann Publisher.

This course is the second part of the core level course on fluid mechanics. Fluid mechanics is concerned with the mechanics of fluids (liquids, gases, & plasmas) & the forces on them. This course covers properties of fluids, laws of fluid mechanics & energy relationships for incompressible fluids. Studies flow in closed conduits, including pressure loss, flow measurement, pipe sizing & pump Selection, momentum equation for frictionless flow, Euler's equations, Bernoulli equation- Integration of Euler's equation, laminar flow & Boundary layers.

### Contents

- 1 Incompressible inviscid flow
- 2 Momentum equation for frictionless flow
- 3 Euler's equations
- 4 Euler's equations in streamline coordinates
- 5 Bernoulli equation- Integration of Euler's equation along a streamline for steady flow
- 6 Relation between first law of thermodynamics & the Bernoulli equation
- 7 Unsteady Bernoulli equation-Integration of Euler's equation along a streamline
- 8 Irrotational flow, internal incompressible viscous flow
- 9 Fully developed laminar flow
- 10 Fully developed laminar flow between infinite parallel plates
- 11 Fully developed laminar flow in a pipe
- 12 Part-B Flow in pipes & ducts
- 13 Shear stress distribution in fully developed pipe flow
- 14 Turbulent velocity profiles in fully developed pipe flow
- 15 Energy consideration in pipe flow
- 16 External incompressible viscous flow
- 17 Boundary layers, the boundary concept, boundary thickness, laminar flat plate
- 18 Boundary layer: exact solution, momentum, integral equation,
- 19 Use of momentum integral equation for flow with zero pressure gradient
- 20 Pressure gradient in boundary-layer flow

*Pre-requisite: Fluid Mechanics-I*

This course is the 1st part of the course series on operation research. Operations research (OR) is an analytical method of problem-solving & decision-making that is useful in the management of organizations. Operations Research studies analysis and planning of complex systems. In operations research, problems are broken down into basic components & then solved in defined steps by mathematical analysis. The objective of Operations Research, as a mathematical discipline, is to establish theories & algorithms to model & solve mathematical optimization problems that translate to real-life decision-making problems. The purpose of the course is to provide students with the concepts and tools to help them understand the operations research and mathematical modeling methods and to understand different application areas of operations research like transportation problem, assignment model, sequencing models, dynamic programming, game theory, replacement models & inventory models.

### *Contents*

- 1 Linear Programming
- 2 Formulation & graphical solution
- 3 Simplex method, M-technique
- 4 Two-phase technique
- 5 Special cases
- 6 Sensitivity analysis
- 7 The dual problem
- 8 Primal dual relationship
- 9 The dual simplex method
- 10 Sensitivity
- 11 Post optimal analysis
- 12 Transportation model
- 13 Northwest corner
- 14 Least cost
- 15 Vogel's approximation methods
- 16 The method of multipliers
- 17 The assignment models
- 18 The transshipment model
- 19 Network minimization
- 20 Shortest route algorithms for variables

### *Recommended Texts*

2. Ravindran, A. R. (2008). *Operations research applications* (1st ed.). North Holland: CRC Press.

Operations Research (OR) is an analytical method of problem-solving & decision-making that is useful in the management of organizations. In operations research, problems are broken down into basic components & then solved in defined steps by mathematical analysis. Disciplines that are similar to, or overlap with, operations research include statistical analysis, management science, game theory, optimization theory, artificial intelligence & network analysis. All of these techniques have the goal of solving complex problems & improving quantitative decisions. The objective of Operations Research, as a mathematical discipline, is to establish theories & algorithms to model & solve mathematical optimization problems that translate to real life decision making problems. Students would be able to identify & develop complicated operational research modals from the verbal description of the real system. The understanding of the mathematical tools that are needed to solve optimization problems would be increased. They would be able to analyze the results & propose the theoretical language understandable to decision making processes in Management Engineering.

### *Contents*

- 1 Algorithm for cyclic network
- 2 Maximal flow problems
- 3 Matrix definition of LP- problems
- 4 Revised simplex methods
- 5 Bounded variables decompositions algorithm
- 6 Parametric linear programming
- 7 Application of integer programming
- 8 Cutting plane algorithm
- 9 Mixed fractional cut algorithm
- 10 Branch methods
- 11 Bound methods
- 12 Zero-one implicit enumeration
- 13 Element of dynamics programming
- 14 Problems of dimensionality
- 15 Solutions of linear program by dynamics programming

*Pre-requisite:* Operation Research-I

### *Recommended Texts*

In classical mechanics, analytical dynamics, or more briefly dynamics, is concerned with the relationship between motion of bodies & its causes, namely the forces acting on the bodies & the properties of the bodies, particularly mass & moment of inertia. Analytical dynamics develops Newtonian mechanics to the stage where powerful mathematical techniques can be used to determine the behavior of many physical systems. The mathematical framework also plays a role in the formulation of modern quantum & relativity theories.

### *Contents*

- 1 Generalized coordinates
- 2 Constraints
- 3 Degree of freedom
- 4 D'Alembert principle
- 5 Holonomic & non-Holonomic systems, Hamilton's principle
- 6 Derivation of Lagrange equation from Hamilton's principle
- 7 Derivation of Hamilton's equation from a variational principle
- 8 Equations & Examples of Gauge transformations
- 9 Equations & examples of canonical transformations
- 10 Orthogonal Point transformations
- 11 The Principle of Least Action
- 12 Applications of Hamilton's equation to central force problems
- 13 Applications to Harmonic oscillator
- 14 Hamiltonian formulism
- 15 Lagrange bracket & Poisson brackets with application
- 16 The Hamilton Jacobi theory, Hamilton Jacobi Theorem
- 17 The Hamilton Jacobi equation for Hamilton characteristic functions
- 18 Bilinear co-variant
- 19 Quasi coordinates
- 20 Transpositional relations for Quasi coordinate
- 21 Lagrange's equation for Quasi coordinates
- 22 Appel's equation for quasi coordinates
- 23 Whittaker equation with applications
- 24 Chaplygian system & Chaplygian equation

This course introduces the basic ideas and equations of Einstein's Special Theory of Relativity to understand the physics of Lorentz contraction, time dilation, the "twin paradox", and  $E=mc^2$ . Calculus Vector transformations Tensors for GTR to understand why we need these two theories. For that see the problems with Galilean transformation & equivalence of inertial & gravitational mass. The most important thing to study SR is to accept geometry as the concept behind it. The math is not difficult; it's the way of thinking you have to adopt. Draw space time diagrams, something to transform to another frame of reference (Lorentz transforms are available). Keep in mind that the view in the other reference frame is just a different view of the same situation that nothing really has changed, even if it looks different on Euclidean paper.

### Contents

- 1 Historical background
- 2 Fundamental concepts of special theory of relativity
- 3 Galilean transformations,
- 4 Lorentz transformations (for motion along one axis)
- 5 Length contraction
- 6 Time dilation
- 7 Simultaneity
- 8 Velocity addition formulae.3-dimensional
- 9 Lorentz transformations
- 10 Introduction to 4-vector formalism
- 11 Lorentz transformations in the 4-vector formalism
- 12 The Lorentz groups
- 13 The Poincare groups
- 14 Introduction to classical mechanics
- 15 Minkowski space-time & null cone
- 16 4-velocity & 4-momentum & 4-force
- 17 Application of special relativity to Doppler shift & Compton effect
- 18 Aberration of light
- 19 Particle scattering, Binding energy
- 20 Particle production & decay
- 21 Special relativity with small acceleration

This course addresses post graduate students of all fields who are interested in numerical methods for partial differential equations, with focus on a rigorous mathematical basis. Many modern & efficient approaches are presented, after fundamentals of numerical approximation are established. Of particular focus are a qualitative understanding of the considered partial differential equation, fundamentals of finite difference, finite volume, finite element, & spectral methods, & important concepts such as stability, convergence, & error analysis. Students who have successfully taken this module should be aware of the issues around the discretization of several different types of PDEs, have a knowledge of the finite element & finite difference methods that are used for discretizing, be able to discretize an elliptic partial differential equation using finite element & finite difference methods, carry out stability & error analysis for the discrete approximation to elliptic, parabolic & hyperbolic equations in certain domains. Students are able to solve following problems: advection equation, heat equation, wave equation, Airy equation, convection-diffusion problems, KdV equation, hyperbolic conservation laws, Poisson equation, stokes problem, Navier-Stokes equations, interface problems.

### Contents

- 1 Finite-Difference Formulae
- 2 Parabolic Equations
- 3 Finite difference methods
- 4 Convergence analysis
- 5 Stability analysis
- 6 Parabolic Equations
- 7 Alternative derivation of difference equations
- 8 Miscellaneous topics,
- 9 Hyperbolic equations
- 10 Characteristics,
- 11 Elliptic equations
- 12 Systematic iterative methods.

Heat transfer is a discipline of thermal engineering that concerns the generation, use, conversion, & exchange of thermal energy (heat) between physical systems. Heat transfer is classified into various mechanisms, such as thermal conduction, thermal convection, thermal radiation, & transfer of energy by phase changes. The objectives of heat transfer include the following: Insulation, wherein across a finite temperature difference between the system & its surrounding, the engineer seeks to reduce the heat transfer as much as possible. The learning outcomes of this course are: to explain the basics of heat transfer, to explain the importance of heat transfer, to define the concept of boiling & condensation, to define the concept of heat exchangers, to explain heat transfer by conduction, to explain the Fourier heat conduction law, to define thermal conductivity coefficient & diffusion coefficient, to explain heat transfer with convection, to explain Newton's law, to explain free transport phenomenon, to explain the forced convection, to explain heat transfer by radiation.

#### *Contents*

- 1 Steady-State Conduction-One Dimension
- 2 Steady-State Conduction-Multiples Dimensions
- 3 Unsteady-State Conduction,
- 4 Principles of Convection
- 5 Empirical & practical Relations
- 6 Forced –Convection Heat Transfer
- 7 Natural Convection Systems
- 8 Radiation Heat Transfer

The objectives of the course are to introduce the concepts of measure & integral with respect to a measure, to show their basic properties, to provide a basis for further studies in analysis, probability, & dynamical Systems, to construct Lebesgue's measure & learn the theory of Lebesgue integrals on real line & in n-dimensional Euclidean space. The goal of the course is to develop the understanding of basic concepts of measure and integration theory. As measure theory is a part of the basic curriculum since it is crucial for understanding the theoretical basis of probability and statistics, so it is intended to develop understanding of the theory based on examples of application. After the course the students will know & understand the basic concepts of measure theory & the theory of Lebesgue integration. The students will understand the main proof techniques in the field & will also be able to apply the theory abstractly & concretely. The students will be able to write the elementary proofs himself, as well as more advanced proofs under guidance. The students will be able to use measure theory & integration in Riemann integration & calculus.

### *Contents*

- 1 Introduction to Lebesgue measure
- 2 Outer measure
- 3 Properties of outer measure
- 4 Further properties of outer measure
- 5 Measurable sets
- 6 Properties of measurable sets
- 7 Non measurable sets
- 8 Measurable functions
- 9 Properties of measurable functions
- 10 Convergence of sequences of measurable functions
- 11 Lebesgue integration, introduction
- 12 Lebesgue integrals of simple
- 13 Bounded functions
- 14 Lebesgue integrals of non-negative functions
- 15 Lebesgue integration of general functions
- 16 General convergence theorems
- 17 convergence in measure

This is the first part of the two-course series of Theory of Splines. This course is designed to teach students about basics of scientific computing for solving problems which are generated by data using interpolation & approximation techniques & learn how to match numerical method to mathematical properties. This course gives the students the knowledge of problem classes, basic mathematical & numerical concepts & software for solution of engineering & scientific problems formulated as using data sets. After successful completion, students should be able to design, implement & use interpolations for computer solution of scientific problems involving problems generated by set of data. The material covered provides the students with the necessary tools for understanding the many applications of splines in such diverse areas as approximation theory, computer-aided geometric design, curve and surface design and fitting, image processing, numerical solution of differential equations, and increasingly in business and the biosciences.

### Contents

- 1 Basic concepts of Euclidean geometry
- 2 Scalar & vector functions
- 3 Barycentric coordinates
- 4 Convex hull, Matrices of affine maps, Translation, rotation, scaling
- 5 Reflection & shear, Curve fitting, least squares line fitting
- 6 Least squares power fit
- 7 Data linearization method for exponential functions
- 8 Nonlinear least-squares method for exponential functions
- 9 Transformations for data linearization
- 10 linear least squares, Polynomial fitting,
- 11 Basic concepts of interpolation, Lagrange's method,
- 12 Error terms & error bounds of Lagrange's method
- 13 Divided differences method,
- 14 Newton polynomials, error terms & error bounds of Newton polynomials
- 15 Central difference interpolation formulae
- 16 Gauss's forward interpolation formula
- 17 Gauss's backward interpolation formula, Hermite's methods

This is the second part of the two-course series of Theory of Splines. The goal of the course is to provide the students with a strong background on numerical approximation strategies & a basic knowledge on the theory of splines that supports numerical algorithms. Interactive graphics techniques for defining & manipulating geometrical shapes used in computer animation, car body design, aircraft design, & architectural design. In this course follow a modular approach & contribute different components to the development of an interactive curve & surface modeling system. Curve Modeling Techniques: Students will implement various curve interpolation & approximation techniques that allow the interactive specification of three-dimensional curves (e.g. Bezier, B-spline, rational curves). Surface modeling techniques: Students will implement various surface interpolation & approximation techniques that allow the interactive specification of three-dimensional surfaces (e.g. Bezier, B-spline, rational surfaces). Simple, 3D Modeling System: Students will integrate the curve & surface modules into a system that allows the user to interactively design & store simple, 3D geometries.

### Contents

- 1 Parametric curves (scalar & vector case), Algebraic form
- 2 Hermite form, control point form, Bernstein Bezier form
- 3 Matrix forms of parametric curves
- 4 Algorithms to compute B.B. form, Convex hull property
- 5 Affine invariance property, Variation diminishing property
- 6 Rational quadratic form, Rational cubic form
- 7 Tensor product surface, B.B. cubic patch
- 8 Quadratic by cubic B.B. patch, B.B. quartic patch, Splines, Cubic splines
- 9 End conditions of cubic splines, Clamped conditions
- 10 Natural conditions, second derivative conditions
- 11 Periodic conditions, Not a knot conditions
- 12 General splines, Natural splines, Periodic splines
- 13 Truncated power function, Representation of spline in terms of truncated power functions
- 14 Odd degree interpolating splines

*Pre-requisite: Theory of Splines-I*

Optimization is a widely used technique in operational research that has been employed in a range of applications. The aim is to maximize or minimize a function (e.g. maximizing profit or minimizing environmental impact) subject to a set of constraints. At the start of the course, the course delivery, the prerequisites of the course will be discussed. The objective of this course is to make students acquire a systematic understanding of optimization techniques. The course will start with linear optimization (being the simplest of all optimization techniques) and will discuss in detail the problem formulation and the solution approaches. Then we will cover a class of nonlinear optimization problems where the optimal solution is also globally optimal, i.e. convex nonlinear optimization and its variants. On successful completion of the course the students will be able to model engineering maxima/minima problems as optimization problems. The students will be able to use computers to implement optimization algorithms. The students will learn efficient computation procedures to solve optimization problems.

### *Contents*

- 1 Introduction to optimization
- 2 Review of related mathematical concepts
- 3 Unconstrained optimization
- 4 Conditions for local minimizers
- 5 One dimensional search methods
- 6 Gradient methods
- 7 Newton's method (analysis & modifications)
- 8 Conjugate direction methods
- 9 Quasi Newton method
- 10 Application to neural network
- 11 Single Neuron Training
- 12 Linear integer programming
- 13 Genetic algorithms
- 14 Real number genetic algorithm

This is continuation of Methods of Optimization I. Optimization is a widely used technique in operational research that has been employed in a range of applications. The aim is to maximize or minimize a function (e.g. maximizing profit or minimizing environmental impact) subject to a set of constraints. At the start of the course, the course delivery, the prerequisites of the course will be discussed. Students will learn the foundations of linear programming, properties of optimal solutions and various solution methods for optimizing problems involving a linear objective function and linear constraints. Students will be exposed to geometric, algebraic and computational aspects of linear optimization and its extensions. On successful completion of the course the students will be able to model engineering maxima/minima problems as optimization problems. The students will be able to use computers to implement optimization algorithms. The students will learn efficient computation procedures to solve optimization problems.

### *Contents*

- 1 Non-linear constrained optimization
- 2 Problems with equality constraints
- 3 Problem Formulation
- 4 Tangent spaces
- 5 Normal spaces
- 6 Lagrange condition
- 7 Second-order conditions
- 8 Problems with inequality constraints
- 9 Karush-Kuhn-Tucker Condition
- 10 Second-order conditions
- 11 Convex optimization problems
- 12 Convex functions
- 13 Algorithms for constrained optimization
- 14 Lagrangian algorithms

*Pre-requisite: Methods of Optimization-I*

The purpose of this course is to elaborate the basic concepts and knowledge about statistics. The course is designed about the importance of statistics in daily life as well as the uses of statistics in different fields of life such as mathematics, agriculture, marketing, finance, geography, mass communication, computer science, engineering, social sciences, and various fields' medical science, etc. This course deals with the graphical representation to gives the general knowledge about how can justify the real life problem throw a graphical way. The course gives the guideline about the measure of the location like arithmetic mean, median, mode, harmonic mean, and geometric mean their uses, advantages and disadvantages with various aspects of real life data set. The application of the measure of dispersion is also an important part of this course. The shape of the distribution, method of identifying the shape of the distribution such as skewness and kurtosis are there in the scheme. The basic concepts of the probability theory, the classical probability with their application in various fields, and the different laws of probability are part of this course. This focuses on the conceptual and numerical formation of descriptive statistics.

### Contents

1. The nature and scope of the statistics.
2. Measurement scales
3. Organizing of Data
4. Classification of Data
5. Graphs and Charts
6. Stem- leaf diagram,
7. Box and whisker plots and their Interpretation.
8. Measures of Central Tendency
9. Measure of Dispersion:
10. Properties of measure location
11. Uses of measure location
12. Application of the measure of dispersion
13. Calculations for the grouped and ungrouped Data.
14. Measures of Skewness
15. Kurtosis
16. Distribution Shapes.
17. Probability Concepts
18. Addition law
19. Multiplication law.

The main objective of introducing this course is to provide the basic concepts about the problems related to the probability theory. This course deals with the different rules of probability like additive and multiplicative law. The course also discusses the conditional probability of the events and their applications in multiple area. The empirical implication of discrete and continuous random variables in casual events is also considered. The course provides an understanding for discrete set of variables and their probability distributions and conversion of the probability distribution on special situations in different phenomena of the practical environments. This course concern with multiple types of discrete probability distributions like Bernoulli distribution, binomial distribution, negative binomial distribution, geometric distribution, Poisson distribution, multinomial distribution, and the hypergeometric distribution. The fitting of the parameter of these distribution and their applications are also the major part of this course. Some continuous type distribution such as Uniform distribution, Normal distribution, exponential distribution, gamma distribution, and beta distribution are also considered at the numerical platform. This course enables how to apply these distributions on real life situations for planning and suggestions.

### Contents

1. Basic concepts of probability
2. Discrete random variable
3. Continuous random variable
4. Laws of Probability
5. Conditional Probability
6. Bernoulli trials.
7. Properties, applications.
8. Fitting of Binomial, Poisson.
9. Hypergeometric distribution,
10. Negative Binomial.
11. Geometric distributions.
12. Continuous Random Variable.
13. Probability density function and its properties.
14. Uniform distribution.
15. Exponential distribution,
16. Beta distribution,
17. Gamma distribution, Normal Distribution and its properties.
18. Standard Normal Curve,
19. Normal approximation to Binomial and Poisson distributions.

Programming Languages plays an important role in Mathematics. More often, the act of programming involves problem-solving in itself, where you then take your answers and apply them to build a program. However, mathematicians sometimes require some programming languages for assistance, and some of the best programming languages for math work wonders when you're trying to hone your skills and train yourself in a particular mathematical field. A number of computer software available to deal with mathematical computing & simulation. This course provide a practical introduction to most widely used Mathematical computing software's namely, MATHEMATICA or MAPLE. Maple has a fairly strong advantage when it comes to combinatorial math problems. It's also known for its functional programming constructs, making it extremely interesting to play around with. After this course students will be able to develop computer programs in this software according to their requirements in mathematical computing. It includes introduction to data-oriented Python packages, decision trees, support vector machines (SVM), neural networks, and machine learning.

### Contents

#### Mathematica

- 1 Introduction to the basic environment of MATHMATICA & its syntax
- 2 Running MATHEMATICA
- 3 Numerical/Algebraic Calculations, vectors, Matrices, Sets, Lists, Tables, arrays
- 4 Symbolic Mathematics in MATHEMATICA
- 5 Functions & functional programming
- 6 Procedural programming, Do, for & while loops, Flow controls
- 7 Graphics, Plots of 2D & 3D functions, Packages within MATHEMATICA

#### Maple

1. Introductory Demonstration of Maple, symbolic computations in MAPLE
2. Vectors, Matrices, Sets, Lists, Tables, arrays & Arrays, Toolbars & Palettes
3. Operators, Constant, Elementary Functions, Procedures
4. If clauses, selection & conditional execution
5. Looping, for & while loop, looping commands, recursion
6. Plots of 2D & 3D functions, Packages within MAPLE

Web technology refers to the means by which computers communicate with each other using markup languages and multimedia packages. It gives us a way to interact with hosted information, like websites. Web technology involves the use of hypertext markup language (HTML) and cascading style sheets (CSS). This course will give an overview of Web Systems and Technologies. Students will learn the essential skills of website management; understanding of the basic Internet technology concepts, develop a prototype of interactive World Wide Web applications. This subject will provide students with the principles and practical programming skills of developing Internet and Web applications. It enables students to master the development skill for both client-side and server-side programming, especially for database applications. Students will have opportunity to put into practice the concepts through programming exercises based on various components of client/server web programming. Students will learn the essential skills of website management; understanding of the basic Internet technology concepts, develop a prototype of interactive World Wide Web applications.

### Contents

1. Overview of WWW, Web Pages, Web Sites, Web Applications,
2. TCP/IP
3. TCP/IP Application, Services, Web Servers
4. WAMP Configuration.
5. Introduction to HTTP, HTML.
6. HTML5 Tags, Dynamic Web Content, CSS and CSS3
7. Client-Side Programming.
8. JavaScript: Basics, Expressions and Control Flow
9. Functions, Objects, and Arrays, Accessing CSS from JavaScript.
10. Form Handling
11. Server-Side Programming:
12. Programing in PHP
13. Introduction MySQL
14. MySQL Functions.
15. Accessing MySQL via php MyAdmin.
16. Cookies, Sessions, and Authentication.
17. Introduction to XML, Ajax, JQuery.
18. Browsers and the DOM.
19. Designing a Social Networking Site.
